Dear Dr. Snyder:

Three Mile Island Nuclear Station, Unit 2 (TMI-2)
Operating License No. DPR-73
Docket No. 50-320
General Project Design Criteria - NRC Comment Resolution

Attached are the GPU Nuclear responses to the NRC comments on the General Project Design Criteria (GPDC) requested in your letter dated December 11, 1984. Also attached is Revision 6 of the GPDC.

If you have questions concerning this information, please contact Mr. J. J. Byrne, of my staff, at TMI Extension 8461.

Sincerely,

F. R. Standerfer
Vice President/Director, TMI-2

FRS/CJD/eml
Attachment
cc: Deputy Program Director - TMI Program Office, Dr. W. D. Travers

GPU Nuclear Corporation is a subsidiary of the General Public Utilities Corporation
NRC Item 1 - Section 2.5 Safety Related

The definition of "safety related" is not current and only allows this classification for equipment needed after/during a safe shutdown earthquake. The more recent staff definition, which can more generally be applied, is stated in 10 CFR 50.49(b)(1). The fact that this definition is contained in a section on electrical equipment is not controlling. It states as follows:

"This equipment is that relied upon to remain functional during and following design basis events to ensure (i) the integrity of the reactor coolant pressure boundary, (ii) the capability to shutdown the reactor and maintain it in a safe shutdown condition, (and) (iii) the capability to prevent or mitigate the consequences of accidents that could result in potential offsite exposures comparable to the 10 CFR Part 100 guidelines. Design basis events are defined as conditions of normal operation (or in abnormal operating conditions for TMI-2), including anticipated operational occurrences, design basis accidents, external events, and natural phenomenon for which plant must be designed to ensure functions (i) through (iii) of this paragraph."

GPU Nuclear Response

The definition of "safety related" as used in the General Project Design Criteria (GPDC) is the same as the definition used in the TMI-2 Recovery Quality Assurance (QA) Plan. The Recovery QA Plan is the Licensing Basis document for QA requirements at TMI-2 and has been reviewed and accepted by the NRC. The purpose of changing the safety related definition in the GPDC was to eliminate an inconsistency between the GPDC and the Recovery QA Plan. Therefore, use of the 10 CFR 50.49(b)(1) definition in the GPDC is not appropriate.

NRC Item 2 - Section 3.2.4 Basic Criteria

As previously stated in NRC correspondence dated August 10, 1984; November 5, 1984; and November 28, 1984, this section is invalid unless proper exemptions or exceptions to the Code of Federal Regulations have been granted.

GPU Nuclear Response

As stated in your letter of November 28, 1984, temporary recovery modifications do not have to meet design basis severe natural phenomena so long as:

1. the structure is temporary;
2. a breach of the component by natural phenomena will not cause a radiological release in excess of 10 CFR 100 limits;
3. or a failure of the component will not compromise the ability to maintain the reactor in a safe shutdown condition.
Based on the above, Section 3.2.4 will be revised to read:

Facilities and systems constructed to support the recovery effort shall not have as part of their design basis the severe natural phenomena for which the plant was originally designed. However, facilities and systems constructed to support the recovery shall be evaluated to ensure that there will be no loss of the required safety function of existing safety-related structures, equipment, or systems needed during the recovery should these events occur. Where there would be a loss of safety function, the facility or system shall have as part of its design basis the severe natural phenomena to the extent that the safety function can be maintained.

Included under "severe natural phenomena" are:

a. Safe shutdown earthquake
b. Tornado and tornado missile
c. Maximum flood

NRC Item 3 – Section 3.4 Regulatory Requirements

This section is misleading. Recovery activities and facilities shall satisfy the requirements of all of Title 10 of Code of Federal Regulations unless a specific exemption to certain sections has been granted. Section (1) should be updated to reflect the Appendix R exemption granted by the staff.

GPU Nuclear Response

GPU Nuclear agrees that recovery activities and facilities shall satisfy all applicable requirements of Title 10 of the Code of Federal Regulations unless a specific exemption has been granted. This section of the design criteria is intended to highlight those sections of Title 10 which are more likely to be involved in the recovery activity or facility.

Section 3.4.1 will be revised to read:

The facilities and activities associated with the recovery shall satisfy all applicable requirements of Title 10 of the Code of Federal Regulations unless a specific exemption has been granted. Listed below are specific sections which are likely to be more frequently applicable:

Section 3.4.1 L will be revised to read:

... to January 1, 1979. An exemption to Sections III.G and III.O has been granted by the NRC (NRC letter Snyder to Kanga, May 18, 1984). An exemption to Section III.J has been requested (GPUNC letter 4400-82-L-0102, dated June 15, 1982, J. J. Barton to Dr. B. J. Snyder).
NRC Item 4 - Note on Page 13

A discussion on many of these guides has been incorporated in the GPU Recovery QA Plan. Therefore, the reference to the Bechtel Nuclear Quality Assurance Manual (NQAM) should be deleted for those cases.

GPU Nuclear Response

In your letter of August 10, 1984, your staff accepted the reference to the Bechtel NQAM in the GPOC as long as it remained consistent with the Recovery QA Plan.

The discussions contained in the Bechtel Nuclear Quality Assurance Manual (NQAM) regarding regulatory guides are consistent with the TMI-2 Recovery QA Plan. The NQAM is revised, as required, to remain consistent with the TMI-2 Recovery QA Plan. Therefore, it is GPU Nuclear's opinion that it is proper to reference the Bechtel NQAM in the GPOC.

NRC Item 5 - Table 4

It appears that the "Access Description" for zones V, VI, and VII should state "normally inaccessible (except) during emergency".

GPU Nuclear Response

Table 4 will be revised to state "normally inaccessible (except) during emergency".

1.0 GENERAL

1.1 INTRODUCTION

1.1.1 This design criteria is applicable only to those facilities and activities for which Bechtel has design responsibility.

1.1.2 This section of the General Project Design Criteria contains information common to all disciplines.

1.1.3 The General Project Design Criteria is applicable to facilities designed by Bechtel for the TMI-2 recovery effort. The criteria presented herein are not applicable to the rebuilding of the unit for power generation. The General Project Design Criteria is to be applied to each facility by reference in each facility's specific design criteria document. Any conflicts between the general and specific criteria must be identified in the specific design criteria document.

1.1.4 Existing plant systems interfacing recovery systems need not be upgraded to current codes and standards applicable to the recovery systems and associated tie-ins.

1.1.5 Recovery project designs pertaining to systems, structures, and components classified as safety related or important to safety shall incorporate pertinent requirements from applicable NRC Regulatory Guides listed in the Project Nuclear Quality Assurance Manual. Systems, structures, and components to which the Project Nuclear Quality Assurance Program applies are identified in the TMI-2 Recovery Quality Classification List (QCL). The QCL is presented in GPUM Procedure 4000-ENG-7313.01 and the Project use of the QCL is described in Project Procedure EDPI 4.28-14.

1.2 PROJECT OBJECTIVES

1.2.1 There are four main objectives of the TMI-2 recovery. These objectives are:

1) Decontaminate the reactor building and equipment contained therein
2) Remove and store the reactor core
3) Decontaminate the Reactor Coolant System
4) Process radioactive waste

1.2.2 In order to achieve these objectives additional facilities and systems will be required. Some of these facilities will be permanent in nature; others will only be for the recovery of the unit and will be removed prior to the unit returning to service.

1.2.3 In addition to the facilities and systems to be provided, there will be plans developed for many of the activities required to achieve the project objectives.
1.3 PROJECT CONCERNS

1.3.1 There are two major concerns that directly influence the design of the facilities and the operations required for the cleanup of TMI-2. These concerns are:

1) Public health and safety
2) Occupational health and safety

2.0 DEFINITIONS

2.1 SAFE SHUTDOWN EARTHQUAKE (SSE)

The safe shutdown earthquake is that earthquake which is based upon an evaluation of the maximum earthquake potential considering the regional and local geology and seismology and specific characteristics of local subsurface material. It is that earthquake which produces the maximum vibratory ground motion for which certain structures, systems, and components are designed to remain functional.

2.2 OPERATING BASIS EARTHQUAKE (OBE)

The operating basis earthquake is that earthquake which, considering the regional and local geology and seismology and specific characteristics of local subsurface material, could reasonably be expected to affect the plant site during the operating life of the plant; it is that earthquake which produces the vibratory ground motion for which those features of the nuclear power plant necessary for continued operation without undue risk to the health and safety of the public are designed to remain functional.

2.3 SEISMIC CATEGORY I/NON-SEISMIC CATEGORY I

Seismic Category I structures, systems, and components for seismic design purposes are defined as those structures, systems, and components important to safety that are designed to remain functional in the event of a safe shutdown earthquake. Items that are both Seismic Category I and important to safety are those structures, systems, and components:

a. that are permanent plant components necessary to ensure the integrity of the reactor coolant pressure boundary,

b. that are necessary to ensure the capability to shut down the reactor or to maintain the reactor in a safe shutdown condition (i.e., maintain subcriticality and decay heat removal), or to prevent a condition or event that could result in a return to nuclear criticality of fuel inside or outside the reactor vessel, or

c. whose failure could result in potential offsite exposures comparable to the guideline values of 10 CFR Part 100. (Note: for the purpose of TMI-2 recovery only, no events or accidents have been postulated which could result in such offsite
exposures. Therefore, it is not expected that the guideline values of 10 CFR Part 100 will be invoked for design or operational-related activities during TMI Unit 2 recovery.

Non-Seismic Category I structures, systems, and components are those whose failure would not result in the release of radioactivity in excess of 10 CFR 100 limits nor prevent reactor safe shutdown.

2.4 DESIGN BASES

Design bases are postulated events/conditions or combinations of events/conditions which establish the function and structural requirements of a structure, system, or component.

2.5 SAFETY RELATED

As used in 10 CFR 100, Appendix A, this term refers to those structures, systems, or components designed to remain functional for the safe shutdown earthquake (SSE) necessary to ensure required safety functions, i.e.:

a. The integrity of the reactor coolant pressure boundary

b. The capability to shut down the reactor and maintain it in a safe shutdown condition; or

c. The capability to prevent or mitigate the consequences of accidents which could result in potential offsite exposures comparable to the guideline exposures of 10 CFR 100.

Safety Related is a subset of Important to Safety.

2.6 IMPORTANT TO SAFETY (ITS)

A special classification or category of those structures, systems, components, and activities that provide reasonable assurance that the facility can be operated without undue risk to the health and safety of the public. It encompasses the broad class of plant features covered (not necessarily explicitly) in the General Design Criteria (10 CFR 50 Appendix A) that contributes in important ways to the safe operation and protection of the public in all phases and aspects of facility operation (i.e., normal operation and transient control as well as accident mitigation). It includes "Safety Related" as a subset.

3.0 LICENSING

3.1 INTRODUCTION

Recovery operations, activities, and work tasks will be performed within the existing TMI-2 Technical Specifications and in accordance with applicable NRC Regulatory Guides. Specific design criteria shall identify applicable Technical Specifications and Regulatory Guide requirements.
3.2 BASIC CRITERIA

3.2.1 Facilities and systems constructed to support the recovery shall not be designed to requirements based on the hypothesis of accidents at power.

3.2.2 Facilities and systems constructed to support the recovery and designated to remain as part of the permanent plant shall be designed to the applicable requirements specified in Chapter 3 of the TMI-2 FSAR in addition to any special requirements necessary for the recovery effort.

3.2.3 To the extent practicable, facilities and services constructed for the recovery effort will be separate from existing facilities and services.

Where it is not practicable to separate the facilities and services constructed for the recovery effort from existing facilities and services, design requirements will be imposed as necessary in order not to compromise the original design bases of the existing facilities and services. These requirements shall be identified in the specific design criteria for the facility and service to be provided. The following will serve as guidelines:

a. Where piping and cables to be left in place when the unit is returned to service are routed through buildings containing seismic Category I piping and cables, the failure of the non-seismic Category I components shall not result in the failure of the seismic Category I components as a result of a seismic event.

b. Where services to support recovery must tie into existing plant services, isolation provisions commensurate with the design requirements of the existing plant service shall be provided.

c. Where piping to be left in place when the unit is returned to service is routed through buildings containing safety-related equipment, the requirements for high energy line break and pipe whip specified in the TMI-2 FSAR shall be satisfied as applicable.

d. Where cables to be left in place when the unit is returned to service are routed through buildings containing safety-related equipment, the requirements for separation and fire protection specified in the TMI-2 FSAR and TMI-2 Fire Protection Reevaluation shall be satisfied as applicable.

3.2.4 Facilities and systems constructed to support the recovery effort shall not have as part of their design basis the severe natural phenomena for which the plant was originally designed. However, facilities and systems constructed to support the recovery shall be evaluated to ensure that there will be no loss of the required safety function of existing safety-related structures, equipment, or systems needed during the recovery should these events occur. Where there would be a loss of
safety function, the facility or system shall have as part of its design basis the severe natural phenomena to the extent that the safety function can be maintained. Included under "severe natural phenomena" are:

- Safe shutdown earthquake
- Tornado and tornado missile
- Maximum flood

3.2.5 Facilities constructed to support the recovery shall not be designed for man-made events not resulting from recovery activities. Included under "man-made events not resulting from recovery activities" are:

- Transportation accidents occurring offsite
- Airplane crashes
- Release of toxic chemicals.

The facilities will be designed to ensure that there will be no loss of required function of existing adjacent safety-related structures, equipment, or systems should these events occur.

3.2.6 Environmental analyses will be performed in accordance with the methodology permitted by the Three Mile Island Nuclear Generating Station Offsite Dose Calculation Manual (ODCM). The site meteorology used for these analyses will be based on that contained in the ODCM.

3.2.7 For purposes of design evolution, the river characteristics specified in Chapter 2 of the TMI-2 FSAR shall be used. River water quality data is that specified in the Plant Design and Mechanical Design Criteria, 13587-2-M01-100.

3.3 DESIGN CONDITIONS

This section defines the spectra of operating conditions to which the activities required for the recovery shall be designed. Also provided are the general design requirements for these operating conditions.

3.3.1 Condition I - Normal Operation

Condition I occurrences are those that can reasonably be expected to occur during the recovery activities. Examples of Condition I occurrences are:

- Those that are normally expected to occur during the recovery including contamination/decontamination resulting from routine activities.
- Operations with equipment out of service or undergoing tests within operational limitations.
Condition I occurrences shall be accommodated with only routine action required to prevent an unplanned release of radioactive materials in effluents to unrestricted areas.

3.3.2 Condition II - Incidents of Moderate Frequency

Condition II occurrences are those any one of which may reasonably be expected to occur during a calendar year and which could result in a release of radioactive material requiring additional support personnel and/or equipment to control. Examples of Condition II occurrences are:

a. Loss of electrical power
b. Minor leakage from systems installed to support the recovery
c. Inadvertent actuation of a single active component in a system installed to support the recovery
d. Single error by an operator engaged in a recovery activity
e. Single active failure of a component (taken as the initiating event) in a system installed to support the recovery

Condition II occurrences shall be accommodated with, at most, a cessation of activities with the capability of resuming the activities after corrective action. Any release of radioactive materials in effluents to unrestricted areas shall be in conformance with Paragraph 20.1 of 10 CFR Part 20, "Standards for Protection Against Radiation."

3.3.3 Condition III - Infrequent Incidents

Condition III occurrences are those which are not expected to occur but are assumed to occur during the lifetime of the recovery effort and could result in a significant release of radioactive material. Examples of Condition III occurrences are:

a. Rupture of any tank utilized for the recovery effort
b. Pipe break in a system installed to support the recovery
c. Fire in an area where recovery activities occur
d. An operating basis earthquake (OBE).
e. Fuel handling accident in the reactor building (Note 2).

Note 2: The source term for the postulated occurrence is based on assuming the assembly with the peak inventory of radioactive material in the THI-2 core is intact. The burnup is based on exact power history. Credit is taken for a decay period of two years or more.
Condition III occurrences may result in damage to recovery facilities sufficient to preclude resumption of recovery activities for a considerable time. The release of radioactive material in effluents to unrestricted areas may exceed the guidelines of 10 CFR Part 20, "Standards for Protection Against Radiation," but shall not be sufficient to interrupt or restrict public use of those areas beyond the exclusion radius.

3.4 REGULATORY REQUIREMENTS

3.4.1 Code of Federal Regulations

The facilities and activities associated with the recovery shall satisfy all applicable requirements of Title 10 of the Code of Federal Regulations unless a specific exemption has been granted. Listed below are specific sections which are likely to be more frequently applicable:

a. 10 CFR Part 20, Paragraph 20.103, Exposure of Individuals to Concentrations of Radioactive Materials in Air in Restricted Areas

b. 10 CFR Part 20, Paragraph 20.105, Permissible Levels of Radiation in Unrestricted Areas

c. 10 CFR Part 20, Paragraph 20.106, Radioactivity in Effluents to Unrestricted Areas

d. 10 CFR Part 50, Paragraph 50.34a, Design Objectives for Equipment to Control Releases of Radioactive Material in Effluents - Nuclear Power Reactors

e. 10 CFR Part 50, Paragraph 50.36a, Technical Specifications on Effluents from Nuclear Power Reactors

f. 10 CFR Part 50, Appendix A, General Design Criteria for Nuclear Power Plants

g. 10 CFR Part 50, Appendix I, Numerical Guides for Design Objectives and Limiting Conditions for Operations to Meet the Criterion "As Low As Is Reasonably Achievable" for Radioactive Material in Light-Water-Cooled Nuclear Power Reactor Effluents, as specified by Appendix R of the Final Programmatic Environmental Impact Statement and incorporated into the TMI-2 operating license by Amendment No. 16

h. 10 CFR Part 100, Reactor Site Criteria

i. 29 CFR Part 1910, Occupational Safety and Health Standards (Department of Labor Regulations)

j. 40 CFR Part 190, Uranium Fuel Cycle Standard (Environmental Protection Agency Regulations)

k. 49 CFR Part 173, Shippers-General Requirements for Shipments and Packagings (Department of Transportation Regulations)
1. 10 CFR Part 50, Appendix R, Fire Protection Program for Nuclear Power Facilities Operating Prior to January 1, 1979. An exemption to Sections III.G and III.I.0 has been granted by the NRC (NRC letter Snyder to Kanga, May 18, 1984). An exemption to Section III.J has been requested (GPUNC letter 4400-82-L-0102, dated June 15, 1982, J. J. Barton to Dr. B. J. Snyder).

m. 40 CFR Parts 260 through 265, Hazardous Waste Regulations (Environmental Protection Agency Regulations)

3.4.2 Regulatory Guides

Table 1 lists many of the regulatory guides which may be applicable to individual facility or system design. This table and other regulatory guides shall be reviewed and any regulatory guides to be implemented shall be included as part of the specific design criteria for the associated facility or system.

3.4.3 Standard Review Plans (SRPs)

The following SRPs and Branch Technical Positions shall be reviewed and the guidance provided used as applicable in designing the facilities and activities to support the recovery.

a. SRP 11.2, Liquid Waste Management Systems, Rev. 1
b. SRP 11.3, Gaseous Waste Management Systems, Rev. 1
c. SRP 11.4, Solid Waste Management Systems, Rev. 1
d. SRP 15.7.3, Postulated Radioactive Releases Due to Liquid Containing Tank Failures, Rev. 1

3.4.4 State Regulations

The facilities and activities associated with the recovery shall satisfy the following:

Title 25, Environmental Resources; Chapter 75, Solid Waste Management (Pennsylvania Department of Environmental Resources Regulations)

3.5 INDUSTRY CODES AND STANDARDS

Applicable industry codes and standards are identified in the individual discipline design criteria along with the effective date statement for the listed codes and standards.
3.6 SAFETY ASSESSMENT

A safety assessment will be performed for each facility and activity to be provided. This assessment shall include a review of the final design to ensure that the safety criteria have been satisfied. When the assessment reveals that the final design does not satisfy the safety criteria, design changes shall be made or administrative controls imposed.

4.0 ALARA DESIGN CRITERIA AND CONSIDERATIONS

The items listed in Table 2 form the basis for the TMI-2 Recovery Project ALARA program. During the design process, the applicable items shall be considered and incorporated into the design as appropriate.
### TABLE 1

<table>
<thead>
<tr>
<th>REGULATORY GUIDES</th>
</tr>
</thead>
</table>

**Discussion**

This guide is applicable to the design of radiation monitoring systems in liquid and gaseous effluent paths and in the design of means for determining the total curie quantity and radionuclide composition of solid wastes shipped offsite with the following clarification.

1. (Ref: Appendix A, Paragraph C) To preclude unnecessary radiation exposure to personnel, the curie and radionuclide determinations for solid radioactive waste shipped offsite will be performed to the extent and level required by Department of Transportation Regulations and 10 CFR Part 71, "Packaging of Radioactive Material." Additional sampling and analysis is not required.

**Discussion**

The assumptions of the guide may be used with the following exceptions or clarifications, in the analysis of the potential radiological consequences of a fuel handling accident.

1. [Ref: Paragraph C.3.b(2)] Whole-body gamma doses and beta-skin doses are presented separately, as the dose from beta radiation of the whole body is negligible. The total dose to the skin is the sum of the beta-skin dose and the whole-body gamma dose.

3. (Ref: Paragraph C.1) The source term for the postulated fuel handling accident is based on assuming the assembly with the peak inventory of radioactive material in the TMI-2 core is intact. The burnup is based on exact power history. Credit is taken for a decay period of two years or more.
3. Deleted

4. Deleted

**Discussion**

This guide is applicable to facilities housing radioactive waste management systems and subject to and as invoked by Reg. Guide 1.143.

**Discussion**

This guide is applicable to facilities housing radioactive waste management systems and subject to and as invoked by Reg. Guide 1.143.

7. Deleted

**Discussion**

This guide is applicable to facilities housing radioactive waste management systems and subject to and as invoked by Reg. Guide 1.143.

**Discussion**

The assumptions of Regulatory Guide 1.109 are followed in the analysis of annual doses to man from routine releases.

10. Deleted

**Discussion**

The applicable methods described in this guide may be used in calculating estimated releases from liquid waste processing systems.

TABLE 1 (Continued)

Discussion

This guide is applicable to systems and facilities that are associated with the control and management of liquid, gaseous, and solid radioactive waste. (Note: radioactive waste means those liquids, gases, or solids containing radioactive materials that by design or operating practice will be processed prior to final disposition.)

Discussion

The design considerations, personnel qualifications, and plans and procedures for ensuring that occupational radiation exposures will be as low as is reasonably achievable are in accordance with Regulatory Guide 8.8 subject to the following clarifications or exceptions:

(1) (Ref: Paragraph C.2) The design features discussed in this paragraph are described in general terms which may permit several acceptable alternative designs for a particular application, e.g., different types or amounts of shielding.

(2) (Ref: Paragraph C.2.g) Airborne monitoring equipment will be provided in areas to which personnel normally have access and in which there is a potential for airborne radioactivity. In addition, area radiation monitors will be provided in areas to which personnel normally have access and where there is a potential for personnel unknowingly receiving high levels of radiation exposure (e.g., in excess of 10 CFR 20 limits) in a short period of time because of system failure or improper personnel action.

Note: For guidance on the following Regulatory Guides, consult the Bechtel Nuclear Quality Assurance Manual (NQAM).

1.26 QA Classifications and Standards for Water Stream and Radioactive Waste Containing Components of Nuclear Power Plants, Rev. 3, February 1976

1.29 Sejsmic Design Classification, Rev. 3, September 1978.

#### Design Criteria 13587-2-L01-100

**TABLE 2**

- **Check that sufficient lighting is provided in areas that contain remote viewing devices to allow their efficient use.**
- **Check that plug-in, accessible, bracket hung, removable units are provided for easy removal and relamping outside high radiation areas. (Lightweight units are preferable for ease of handling.)**
- **Check that extension cord powered units stored on brackets and cord hangers outside the entrance are provided if permanent units are not practical, and the pre-placed brackets are provided within the high radiation area to facilitate installation.**
- **Check that long-life bulbs are provided in high radiation areas (Zone V).**

**Contamination Control and Coatings**

- **Check the floor drains and properly sloped floors are provided for each room or cubicle containing serviceable components with radiation levels of a Zone III or higher.**
- **Check that local gas traps or porous seals are not used on floor drains from radiation areas.**
- **Check that gas traps are provided at the common sump or collection tank.**
- **Check that concrete surfaces in areas of potential contamination are covered with a smooth-surfaced coating for the floor and wainscot, which will allow easy decontamination.**
- **Check that threshold curbs, cofferdams, or other means are provided to control radioactive leakage or spills.**
### TABLE 2 (Continued)

<table>
<thead>
<tr>
<th>Item No.</th>
<th>Responsibilities</th>
<th>Note</th>
